SUMMARY

Software Engineer with 5+ years of experience at Amazon, Microsoft & Property Finder, focused on building scalable, distributed systems. Tech-agnostic and adaptable, with a strong track record of delivering customer-centric, extensible solutions that drive measurable business outcomes. Skilled at simplifying complex challenges into secure, compliant, and maintainable architecture.

TECHNICAL SKILLS

- **Languages:** Go, C++, Java, Python, C#, HTML, TypeScript, JavaScript, CSS
- **Frameworks:** Spring Boot, React, .NET, Gin
- **Cloud & DevOps:** AWS, Azure, Docker
- **Databases:** DynamoDB, PostgreSQL
- **Concepts:** System Design, Microservices, Accessibility

PROFESSIONAL EXPERIENCE

Property Finder – Software Engineer | Dubai, UAE (Remote) | September 2025 – Present

- Handled auctions and slot bidding for communities, ranking, credit transactions, launching bundles to boost business over and beyond credits. Identified and reconciled stale slots for properties that were featured with expired/inactive bids.
- Developed a compliance orchestration service integrating with government APIs to automatically validate property listings and ensure continuous alignment with regional real-estate regulations across multiple markets.
- Built a geofencing microservice enabling operations to control client publishing rights by region—extensible to street-level accuracy using a hierarchical location-tree model for granular access management.
- Redesigned system throttling logic to overcome API rate limits (4 TPS) by implementing a Pub/Sub architecture, shifting from active polling to event-driven updates. This optimized system reliability and reduced API failures by eliminating redundant calls while maintaining daily listing compliance.
- Migrated Terraform stacks to AWS CDK and guided other teams through adoption for scalable, standardized IaC.

Microsoft – Software Engineer II | Hyderabad, India | Jun 2024 – July 2025

- Member of the Dataverse team responsible for data import/export in Dynamics 365 F&O.
- Built automation and AI-driven tools to detect and mitigate common customer issues, reducing customer-raised incidents by ~30%.
- Optimized SLA adherence by reducing noise caused by user errors through backend improvements and proactive support mechanisms.

Amazon – SDE II | Hyderabad, India | Jul 2023 – May 2024

- Designed and built a scalable notification service using Spring Boot and AWS that supported over 2 million monthly events, with capabilities for real-time and scheduled dispatch.

- Improved delivery success rate by 25% and reduced message processing latency by 40% through efficient batching and asynchronous job handling.
- Developed a React-based management console for clients to create, edit, and schedule notification templates. Enabled 30+ internal teams to self-manage workflows, cutting dependency on dev teams by 60%.
- Integrated comprehensive accessibility improvements (WCAG 2.1 AA compliant) and implemented instrumentation that captured UX telemetry, increasing actionable UI feedback by 3x and reducing issue triage time by 50%.
- Created an end-to-end approval workflow with versioning support, enabling auditability and rollback across 1000+ template versions with granular access control.

Amazon – SDE I | Hyderabad, India | Sep 2021 – Jun 2023

- Contributed to the development of a new internal product from concept to production launch.
- Developed services using React, Spring, and AWS (API Gateway, S3, DynamoDB, CloudFront).
- Mentored new hires and handled high-severity production issues under tight SLAs.

EDUCATION

B.Tech in Computer Science, AKGEC Ghaziabad (2017 – 2021)
